### WARRANTY

Motospecs recognises the importance of customer confidence and satisfaction in the quality of its products. All Tru-Flow parts are warranted against defects in workmanship or material for a period of 2 years or 40,000kms from the date of sale, whichever occurs first, unless otherwise stated. Tru-Flow parts found upon examination by an authorised Motospecs representative to be defective in material or workmanship will be replaced by Motospecs. The cost of returning parts under this warranty must be borne by the customer and must be pre-paid. In order to make a claim under this warranty, the faulty product, proof of purchase and the reason for or details of the failure must be provided to Motospecs.

This warranty does not cover damage by misuse or improper installation, or liability for labour charges or consequential loss or damage incurred as a result of the failure of a Tru-Flow part.

### FOR GOODS PURCHASED IN AUSTRALIA ONLY

Our goods come with guarantees that cannot be excluded under the Australian Consumer Law.

You are entitled to a replacement or refund for a major failure and for compensation for any other reasonably foreseeable loss or damage. You are also entitled to have the goods repaired or replaced if the goods fail to be of acceptable quality and the failure does not amount to a major failure.

### COPYRIGHT NOTICE

Motospecs, a division of GPC Asia Pacific Pty Ltd ABN 97 097 993 283 is the owner of copyright in this publication, including layout, drawings, photographs, text and part number systems. No part of this catalogue may be reproduced or copied in any form or by any means without the prior written permission of Motospecs.

This catalogue has been prepared for the Australian market. Due to vehicle production changes and supersession, you should ensure that the part you are selecting is suitable for your application.

## **Corrosion, Contamination or Cavitation Damage**

### **Cause**

- **Not using pure water**
- **Not Flushing Cooling system correctly**
- **Re-using old coolant**
- **Incorrect ratio of coolant to pure water**
- **Incorrect or insufficient bleeding of air from cooling system**

### **Prevention**

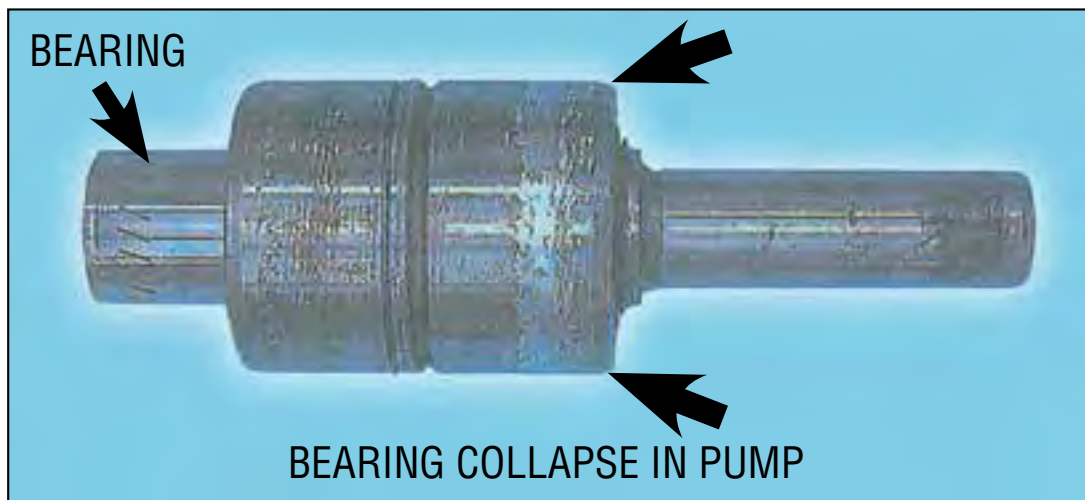

- **Never reuse old coolant**
- **Never fill cooling system with water only**
- **Always flush cooling system (*including heater core*) before fitting new water pump.**
- **Always use the correct coolant in the appropriate ratio of pure water.**
- **Always correctly bleed the cooling system. Re-check / re-bleed after engine has been run with new pump.**

## **Bearing Collapse / Shaft Damage**

- Cause**
- **Drive Belt Overtightened**
  - **Faulty Fan or Fan Clutch Assembly**

- Prevention**
- **Tension drive belt to manufacturers specifications – *do not overtighten the drive belt***
  - **Replace fan / fan clutch when fitting new pump**

## COMMON WATER PUMP FAILURES AND THEIR CAUSES

### LEAKING OR SEEPAGE FROM THE WEEP HOLE

Leaking or seepage from the weep hole is a sure sign of seal failure. The life of the seal can be greatly extended by performing regular maintenance of your cooling system. Periodic inspection of hoses and coolant recovery tank will assure coolant levels are correct and that no atmospheric contaminants that can cause oxidation and sludge build-up are present. Sludge build-up in the cooling system is a primary cause of seal failure as well as reduced cooling system efficiency.

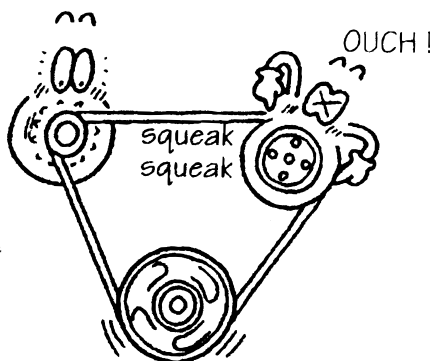

The water pump seal is delicate, rust and core residue will cause the seal to corrode and leak prematurely.

### NOISE NEAR THE WATER PUMP

Often noises are mistaken as being the water pump when in most cases they are caused by slippage of the fan belt on the pulleys (refer to fan belt tension). In rare cases if the noise is from the water pump, by adding soluble oil into the radiator may eliminate this problem. It is common when checking a water pump and turning it by hand that it makes a squeaking sound from the mechanical seal area. This disappears when the pump is filled with water.

#### Reason:

Since noises are often caused by fan belt slippage it is important that quality fan belts are used.

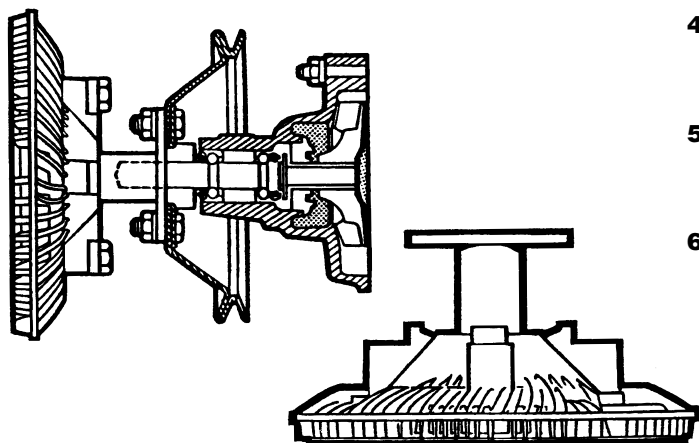

### FAN CLUTCHES

When a water pump fails, the fan clutch fails.

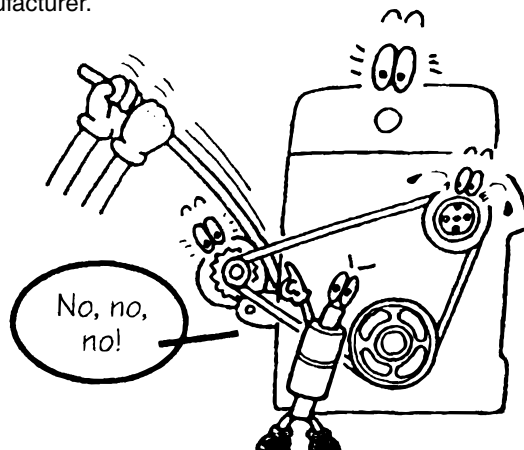

The water pump and fan clutch share the same shaft. Should the water pump bearing fail, the fan clutch bearing generally also fails and both must be replaced.

The fan clutch is designed to "drive" the fan blade when air is needed to cool the engine. It is also designed to take fan blade "load" from the engine when additional air movement is not needed.

### FAN BELT TENSION

Problems will arise if the fan belt tension is too loose or too tight. Ensure the correct tools are used for the job and adjust the fan belt to the correct tension specified by the vehicle manufacturer.

#### Reason:

If the belt tension is too great it will result in overloading the water pump bearing, causing premature failure and possible cracking of the pump casing. Insufficient tension will result in overheating as the belt slippage on the water pump will not circulate the correct volume of water required to cool the engine.

### BROKEN WATER PUMP HOUSINGS AND SHAFTS ARE COMMONLY CAUSED BY EXCESSIVE VIBRATION AND UNBALANCE DUE TO:

- Bent, cracked or broken fan;
- Fan not squarely mounted on the shaft;
- Cracked or bent pulleys due to improper installation.

#### Replace the fan clutch when:

1. **Engine overheating** – fan spins freely – does not engage.
2. **Excessive fan clutch play** – manually move the fan back and forth. If there is more than 1/4" play the clutch bearing is worn.
3. **Greasy build up** – Look for greasy dirt on the fan clutch. Check for fluid leakage around the outer edge and at centre of thermostat spring.
4. **Excessive slippage** – A hot engine in the "off" position which allows easy revolving of the fan manually, from 1 to 1 revolutions indicates a weak clutch.
5. **Freezing up** – If the fan blade cannot be rotated by hand, or if hand rotation makes a harsh, rumbling noise, the fan clutch bearing has failed.
6. **Shaft vibration** – The fan clutch is mounted on the water pump between the water pump shaft and the fan. Any vibration can mean a worn bearing in the water pump or fan clutch. Since the fan clutch and water pump have about the same life span, it generally makes sense to replace both at the same time. Unless there are obvious signs of damage, it is seldom necessary to replace the fan when installing a new clutch.

This image shows a full page of blank, lined paper. It features approximately 20 evenly spaced horizontal grey lines across its entire surface, providing a guide for handwriting or typing. The paper itself is a clean, off-white color.
